# **The National Stormwater** Quality Database (NSQD) Version 4

### Alex Maestre<sup>1</sup>, Robert Pitt<sup>1</sup>, Jane Clary<sup>2</sup>

Department of Civil, Construction, and Environmental Engineering<sup>1</sup>

Denver, Colorado

2015 American Water Resources Conference Denver, Colorado | November 16-19 2015

Introduction

- Reference for urban stormwater quality throughout the United States
- The database is organized by State, EPA Rain Region, and Land Use
- Started in 2001 compiling the results of Phase I NPDES Municipal Separate Sewer Storm Systems in collaboration with the Center of Watershed Protection
- Current version contains the results of about 9,100 storm sampling events

2

1

## Sources of Information

- Almost 600 sampling locations, with a median of 10 samples per site (maximum 115). More than 700 new storms were added to this most recent version of the database in addition to reviewing and adding supporting information for the complete dataset.
- We recently compiled new information from Colorado (34 sites), California (2 sites), and Kansas (10 sites).
- We also developed and conducted an expanded QA/QC process for the complete dataset. We reviewed and standardized notes, supporting information, and qualifiers for each record. Most of the NSQD effort is expanded in QA/QC analyses.
- Most of the data in version 4 was obtained from Phase I NPDES municipal monitoring programs along with several other sources.

Data Origin for NSQD Information							
Source	Total Storms	Percentage					
Phase I NPDES (MS4)	5,707	62.5					
EPA's Nationwide Urban Runoff Program (NURP)	1,757	19.2					
International BMP Database (influent data at outfalls)	883	9.7					
Special Projects (USGS, state programs, and others)	783	8.6					
TOTAL	9,130	100					

5

New Features in Version 4.0 (in addition to expanded data coverage and expanded QA/QC)
Descriptive Statistics including censored values

Average
Median
Standard Deviation

Probability Distribution including censored values

First Quartile (Q1)
Median
Third Quartile (Q3)
Total of 15 percentile values to represent the complete distribution

Also integrated with BMP International Database statistical summaries

## Site and Sampling Method Descriptions

- Narrative about each municipality/site monitoring program
- Aerial photos
- Watershed delineation (if available)
- Methods used for sampling and for the water quality analyses
- Constituents collected and period of collection
- Each report for each municipality is approximately 7 pages long
- These reports are in progress and will be available on the NSQD/International BMP website

10

#### National Stormwater Quality Database

#### Overview

The National Stormwater Quality Database (NSQD) is an urban stormwater runoff characterization database developed under the direction of Dr. Robert Pitt, P.E., of the University of Alabama and the Center for Watershed Protection under support from the U.S. Environmental Protection Agency. Originally released in 2001, followed by several updates, it has recently moved to a new long-term home as a companion project to the International Stormwater BMP Database. The NSQD is being maintained as a spearate stand-all index to an an important resource for municipal stormwater managers and researchers who are seeking urban runoff characterization data. The NSQD can be searched for water quality data based on land use, state, and EPA Rain Zone, along with several other criteria. The NSQD can be downloaded from this website, and a new on-line user interface will be developed in the future.

#### Download the NSQD

- The NSQD Version 3.1 (last updated March 2011) can be downloaded in two formats containing the same information:
- 1. NSOD Version 3.1 Excel Spreadsheet (original format) Coming Soon
- 2. NSQD Version 3.1 Access Database (new format) Coming Soon

#### Papers and Previous NSQD Analyses

During the transition of the NSQD to its new home, additional explanatory information can be accessed here .

#### NSQD History

In 2001, the University of Alabama and the Center for Watershed Protection were awarded a U.S. Environmental Protection Agency. Office of Water 104(b)3 grant to collect and evaluate stormwater data from a portion of the NPDES (National Pollutant Discharge Elimination System) MS4 (municipal separate storm sewer system) stormwater permit holders. In 2008, the NSQD was updated with additional data under continued 104(b)3 support from the EPA. These stormwater quality data and site descriptions were collected and reviewed to describe the characteristics of national stormwater quality, to provide guidance for future sampling needs, and to enhance local stormwater management activities in areas having limited data. The monitoring data collected over nearly a ten-year period from more than 200

### Examples of Past Evaluations Conducted using the

### NSQD to Explore Fundamental Stormwater

### **Characteristics and Experimental Design Suggestions**

- Explain variations in stormwater quality by identifying significant land use, geographical area, and seasonal effects. Also examined effects of amount of impervious cover and size of drainage area on stormwater quality.
- Examine trends in stormwater quality with time (reflecting pollution prevention effects of lead removal from gasoline for example).
- Compare sampling effects on stormwater quality (automatic samplers vs. grab samples; time-weighted vs. flow-weighted composites; first flush vs. whole event samples).
- Determine the best approach in handling non-detectable results in the data base (compare different data substitution methods for effects on statistical measures).
- Determine suggested analytical methods to minimize detection limit problems when conducting stormwater monitoring activities.
- Verify the number of samples needed during stormwater monitoring to meet specific data quality objectives by determining actual expected variability in stormwater quality.

17

Even with lots of variability, the large number of samples and well distributed conditions enable significant data groupings to be identified based in the significant factors affecting the concentrations.

Central	4	2	4	1	5	3	19		
East Coast	3	1	1	1	2	3	11		
Great Lakes (the USGS/DNR files)	6	4	4	2	11	4	31		
Northwest	2	1	1	1	3	3	11		
Southeast	7	2	3	5	8	4	29		
Southwest	5	1	1	1	2	3	13		
Total by Land Use	27	11	14	11	31	20	114		
							23		

## Summary

- The NSQD can be used to estimate expected stormwater conditions in areas lacking data. These data can be used for preliminary evaluations and to develop monitoring programs such as to identify critical areas needing additional data.
- NSQD can be used for stormwater quality model calibration.
- The database can be used to test common assumptions concerning stormwater characteristics, such as the role of first flush, monitoring methods, geographical location, watershed area, etc.
